TITLE: Front End Development Using React JS

GITHUB LINK: <https://github.com/Manoj0000007-x5/React-JS.git>

LOCAL HOST LINK: <http://localhost:5173/>

1. ABSTRACT

This project is a simple Workshop Registration & Confirmation App developed using React JS. It allows users to register for different workshops by entering their name and email. After registration, a confirmation message is displayed and the participant details are shown in a table. The application also prevents duplicate registrations using email validation. The project helped in

understanding React concepts such as components, state management, event handling and conditional rendering..

2. PROBLEM STATEMENT

Many institutions conduct workshops and often manage registrations manually. This can lead to duplicate entries, missing records and difficulty in tracking participants. The project provides a simple digital solution for managing workshop registrations efficiently.

3. OBJECTIVES

- *Create a registration form.*
- *Store participant details.*
- *Display confirmation messages.*
- *Prevent duplicate registrations.*
- *Learn React state management and event handling.*

4. PROJECT SCOPE

The application allows participants to register for workshops, stores participant information during runtime and displays registered users. Future improvements can include database storage, authentication and email notifications.

5. TECHNOLOGIES USED

React JS, JavaScript, HTML, CSS, JSX, React Hooks (use State), Visual Studio Code and GitHub.

6. APPLICATION FLOW

The user enters name and email, selects a workshop and submits the form. The system validates the input, checks for duplicate emails and either shows an error message or registers the participant successfully. The participant list is then updated and displayed.

7. KEY REACT CONCEPTS USED

Functional Components, useState Hook, Event Handling, Conditional Rendering, List Rendering using map(), State Management and JSX.

8. EXPECTED OUTPUT

The application should display a registration form, allow workshop selection, prevent duplicate registrations, show confirmation messages and display all registered participants in a table.

Workshop Registration

Thank you Sample name! You are successfully registered for "Data Structures Basics".

Registered Participants (1)

#	Name	Email	Workshop
1	Sample name	sample@gmail.com	Data Structures Basics

9. CHALLENGES FACED

Understanding state updates, handling form validation and implementing duplicate email checking were some challenges. These were solved using React hooks and conditional logic.

10. LEARNING OUTCOMES

Learned React fundamentals, state management, form handling, validation techniques, dynamic rendering and basic frontend project development.

11. CONCLUSION

The project was successfully completed and met all the required objectives. It provides an easy way to register participants and avoid duplicate entries while demonstrating important React concepts.
